Trustix Firewall

DMZ Overview

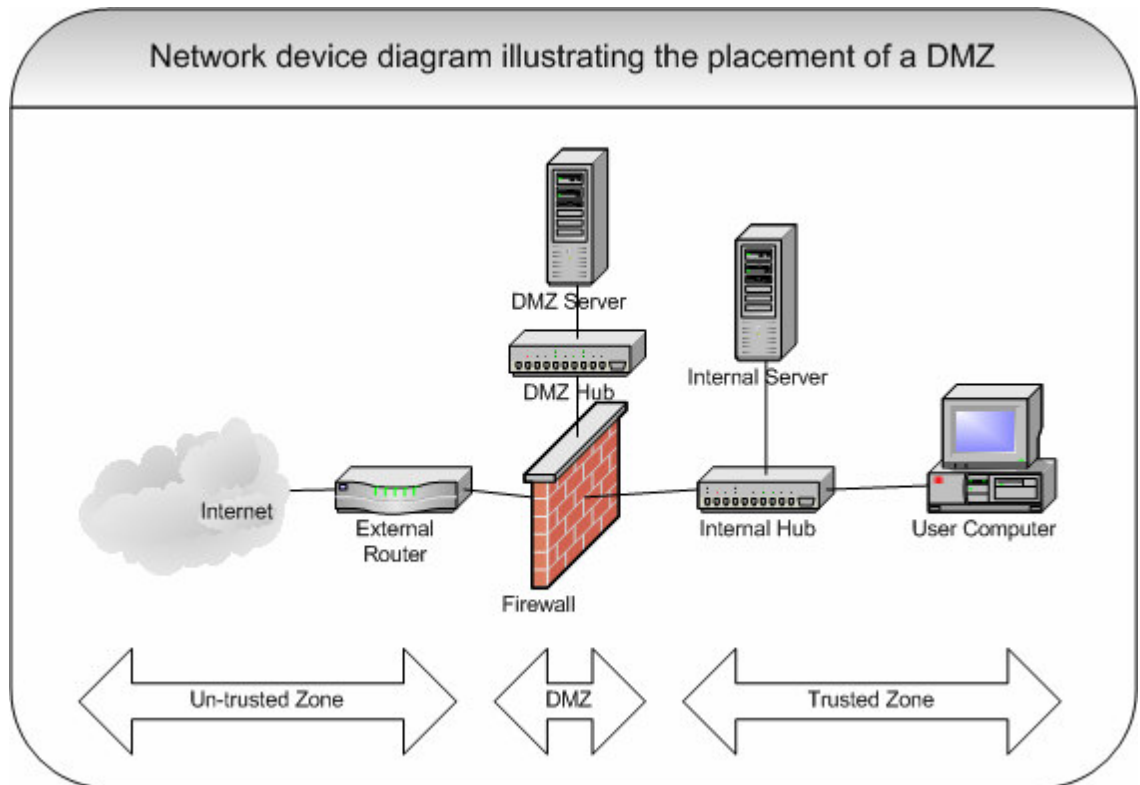

An area of an organization's network which is open to the public over the Internet and is separated from the organization's private network by a firewall

Your network may have public servers (such as Web, mail or FTP servers) that need to be accessed from both the Internet and from the LAN.

These public servers should be placed on a third network - referred to as a Demilitarized Zone (DMZ).

Although this sounds pretty serious, it really is just an area that is outside the firewall.

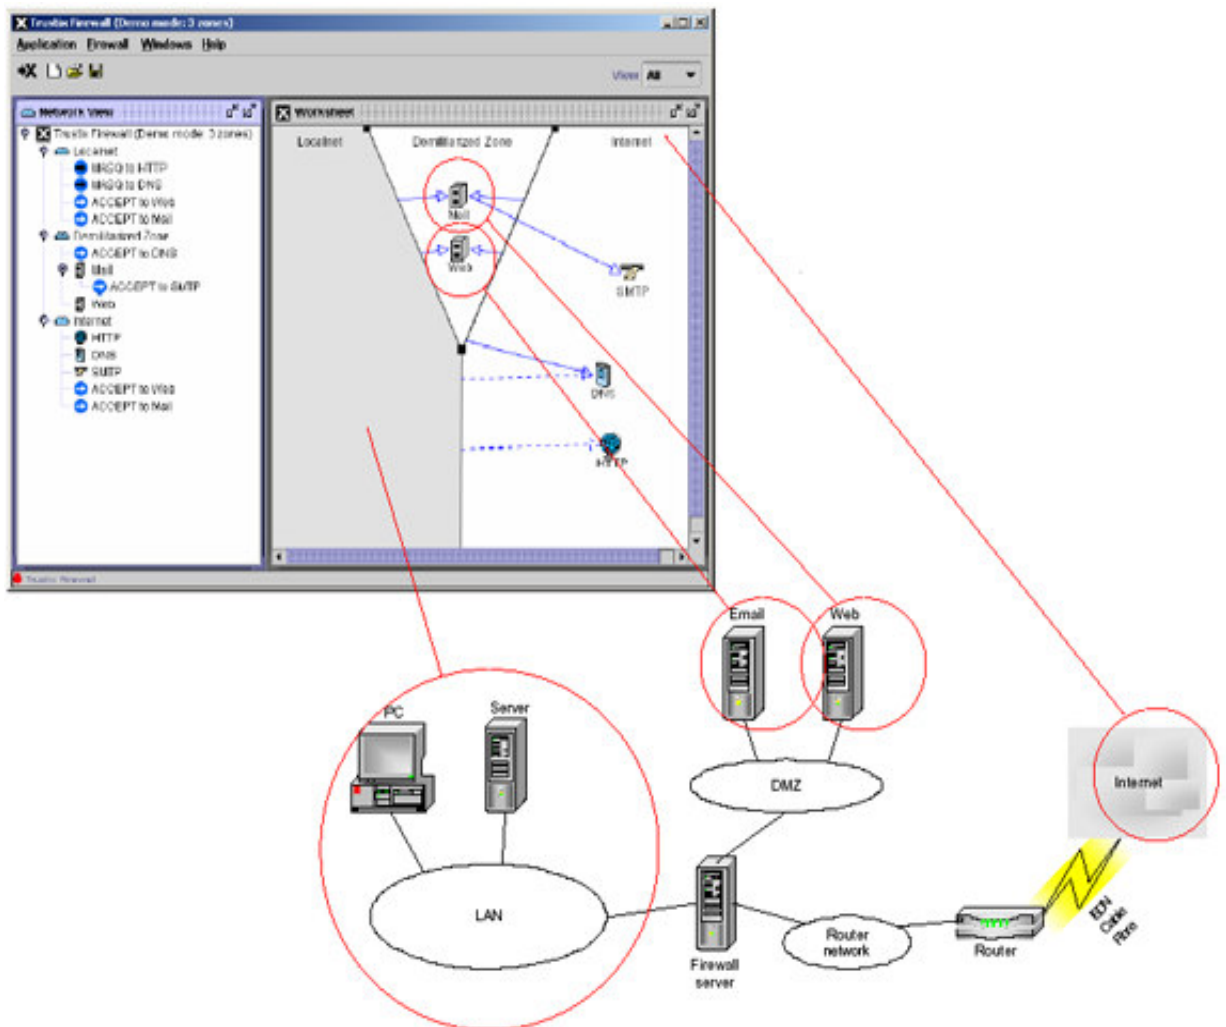

The DMZ is protected from most attacks, but you can assign it a different set of rules so that it can perform its given function without compromising your internal network.

Configuration of Firewalls and DMZs used to be a recondite task- suitable only for highly skilled IT professionals- Until the introduction of Trustix™ Firewalls, the world's first WYSIWYG firewall.

Trustix WYSIWYG Firewall

By adopting a highly visual common sense approach to the deployment of network rules and DMZ settings, the Trustix™ Firewall is the easiest way to navigate the hazardous road of Firewall configuration. You will not have to be a fully trained IT specialist in order to optimize network settings and maximize the security and performance of your architecture.

Apart from your DMZs (up to 24 zones), the WYSIWYG interface also controls port forwarding, network address translation (NAT) and can oversee any virtual private networks (VPNs) you have.

Trustix™ Firewalls also provide a superb growth path for your business. Each of the firewalls can be seamlessly integrated with any component in the Trustix™ suite of business solutions to provide the complete office solution. If your business grows, then Trustix™ Firewalls will grow with you- expandable from 2 DMZs up to 24 DMZs for corporate sized enterprises- and at a price that makes sense whatever the size of your operation.
